## SELF-DIAGNOSIS FUNCTION

The self-diagnosis function consists of error codes for customers which are displayed automatically when errors occur, and error codes which show the error history in the test mode during servicing. For details on how to view error codes for the customer, refer to the following box in the instruction manual. For details on how to check error codes during servicing, refer to the following “Procedure for using the Self-Diagnosis Function (Error History Display Mode)”.

### Self-Diagnosis Function

The deck has a self-diagnosis display. This function shows a three-digit display (a combination of a letter and figures) and the corresponding message alternately, so you can check the deck's condition.

If such a display appears, check the following table in order to resolve the problem.

Should any problem persist, consult your nearest Sony dealer.

Self-diagnosis display

Three-digit display/Message	Cause/Remedy
C11/Protected	The inserted MD is record-protected. ➔ Take out the MD, and close the record-protect tab.
C13/REC Error	The recording was not made properly. ➔ Set the deck in a stable place, and repeat the recording procedure. The inserted MD is dirty (with smudges, fingerprints, etc.), scratched, or not up to standards. ➔ Replace the disc, and repeat the recording procedure.
C13/Disc Error	The deck could not read the TOC of the MD properly. ➔ Take out the MD, and insert it again.
C14/Disc Error	The deck could not read the TOC of the MD properly. ➔ Insert another disc. ➔ If possible, erase all tracks on the MD using the All Erase Function.
C71/1)in Unlock	A moment's lighting is due to the signals of the digital program being recorded. This does not affect the recorded material. While recording from a digital component connected through the digital input connector, the digital connecting cable was unplugged or the digital component turned off. ➔ Connect the cable or turn the digital component back on.

### Procedure for using the Self-Diagnosis Function (Error History Display Mode).

**Note:** Perform the self-diagnosis function in the “error history display mode” in the test mode. The following describes the least required procedure. Be careful not to enter other modes by mistake. If you set other modes accidentally, press the MENU/NO button to exit the mode.

1. While pressing the [◀◀ AMS ▶▶] knob and [■] button, connect the power plug to the outlet, and release the [◀◀ AMS ▶▶] knob and [■] button.
2. Rotate the [◀◀ AMS ▶▶] knob and when “[Service]” is displayed, press the [YES] button.
3. Rotate the [◀◀ AMS ▶▶] knob and display “ERR DP MODE”.
4. Pressing the [YES] button sets the error history mode and displays “total rec”.
5. Select the contents to be displayed or executed using the [◀◀ AMS ▶▶] knob.
6. Pressing the [◀◀ AMS ▶▶] knob will display or execute the contents selected.
7. Pressing the [◀◀ AMS ▶▶] knob another time returns to step 4.
8. Pressing the [MENU/NO] button displays “ERROR DP MODE” and exits the error history mode.
9. To exit the test mode, press the [REPEAT] button. The unit sets into the STANDBY state, the disc is ejected, and the test mode ends.

**Items of Error History Mode Items and Contents**  
**Selecting the Test Mode**

Display	Details of History
total rec	Displays the recording time. Displayed as "r□□□□□h". The displayed time is the total time the laser is set to the high power state. This is about 1/4 of the actual recording time. The time is displayed in decimal digits from 0h to 65535h.
total play	Displays the play time. Displayed as "p□□□□□h". The time displayed is the total actual play time. Pauses are not counted. The time is displayed in decimal digits from 0h to 65535h.
retry err	Displays the total number of retries during recording and number of retry errors during play. Displayed as "r□□ p□□". "r" indicates the retries during recording while "p" indicates the retry errors during play. The number of retries and retry errors are displayed in hexadecimal digits from 00 to FF.
total err	Displays the total number of errors. Displayed as "total □□". The number of errors is displayed in hexadecimal digits from 00 to FF.
err history	Displays the 10 latest errors. Displayed as "0□ E@@". □ indicates the history number. The smaller the number, the more recent is the error. (00 is the latest). @@ indicates the error code. Refer to the following table for the details. The error history can be switched by rotating the  knob.
er refresh	Mode which erases the "retry err", "total err", and "err history" histories. When returning the unit to the customer after completing repairs, perform this to erase the past error history. After pressing the  button and "er refresh?" is displayed, press the <b>YES</b> button to erase the history. "Complete!" will be displayed momentarily. Be sure to check the following when this mode has been executed. <ul style="list-style-type: none"> <li>• The data has been erased.</li> <li>• The mechanism operates normally when recording and play are performed.</li> </ul>
tm refresh	Mode which erases the "total rec" and "total play" histories. These histories serve as approximate indications of when to replace the optical pickup. If the optical pickup has been replaced, perform this operation and erase the history. After pressing the  button and "tm refresh?" is displayed, press the <b>YES</b> button to erase the history. "Complete!" will be displayed momentarily. Be sure to check the following when this mode has been executed. <ul style="list-style-type: none"> <li>• The data has been erased.</li> <li>• The mechanism operates normally when recording and play are performed.</li> </ul>

### SAFETY CHECK-OUT

After correcting the original service problem, perform the following safety check before releasing the set to the customer: Check the antenna terminals, metal trim, “metallized” knobs, screws, and all other exposed metal parts for AC leakage. Check leakage as described below.

### LEAKAGE TEST

The AC leakage from any exposed metal part to earth ground and from all exposed metal parts to any exposed metal part having a return to chassis, must not exceed 0.5 mA (500 microamps.). Leakage current can be measured by any one of three methods.

1. A commercial leakage tester, such as the Simpson 229 or RCA WT-540A. Follow the manufacturers’ instructions to use these instruments.
2. A battery-operated AC milliammeter. The Data Precision 245 digital multimeter is suitable for this job.
3. Measuring the voltage drop across a resistor by means of a VOM or battery-operated AC voltmeter. The “limit” indication is 0.75 V, so analog meters must have an accurate low-voltage scale. The Simpson 250 and Sanwa SH-63Trd are examples of a passive VOM that is suitable. Nearly all battery operated digital multimeters that have a 2 V AC range are suitable. (See Fig. A)

## JIG FOR CHECKING BD BOARD WAVEFORM

The special jig (J-2501-149-A) is useful for checking the waveform of the BD board. The names of terminals and the checking items to be performed are shown as follows.

GND : Ground

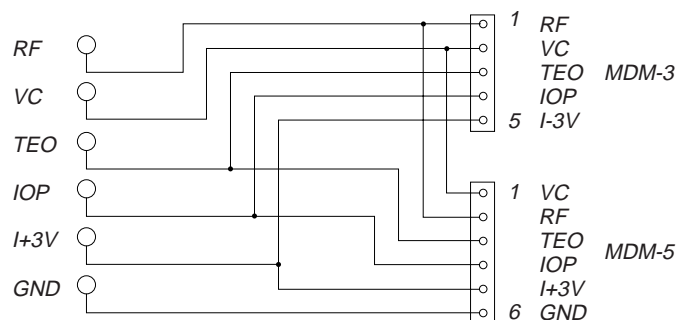

I+3V : For measuring IOP (Check the deterioration of the optical pick-up laser)

IOP : For measuring IOP (Check the deterioration of the optical pick-up laser)

TE : TRK error signal (Traverse adjustment)

VC : Reference level for checking the signal

RF : RF signal (Check jitter)

## IOP Data Recording and Display When Pickup and Non-volatile Memory (IC171 of BD board) are Replaced

The IOP value labeled on the pick-up can be recorded in the non-volatile memory. By recording the value, it will eliminate the need to look at the value on the label of the optical pick-up. When replacing the pick-up or non-volatile memory (IC171 of BD board), record the IOP value on the pick-up according to the following procedure.

### Record Procedure:

1. While pressing the  knob and  button, connect the power plug to the outlet, and release the  knob and  button.
2. Rotate the  knob to display “[Service]”, and press the  button.
3. Rotate the  knob to display “Iop.Write” (C28), and press the  button.
4. The display becomes “Ref=@@.@” (@ is an arbitrary number) and the numbers which can be changed will blink.
5. Input the IOP value written on the optical pick-up.  
To select the number: Rotate the  knob.  
To select the digit: Press the  knob.
6. When the  button is pressed, the display becomes “Measu=@@.@” (@ is an arbitrary number).
7. As the adjustment results are recorded for the 6 value. Leave it as it is and press the  button.
8. “Complete!” will be displayed momentarily. The value will be recorded in the non-volatile memory and the display will become “Iop Write”.
9. Press the  button to complete. “Standby” will be displayed.

### Display Procedure:

1. While pressing the  knob and  button, connect the power plug to the outlet, and release the  knob and  button.
2. Rotate the  knob to display “[Service]”, and press the  button.
3. Rotate the  knob to display “Iop.Read” (C27).
4. “@@.@/##.#” is displayed and the recorded contents are displayed.  
@@.@: indicates the Iop value labeled on the pick-up.  
##.#: indicates the Iop value after adjustment
5. To end, press the  button or  button to display “Iop Read”. Then press the  button to display “Standby”.

## Checks Prior to Parts Replacement and Adjustments

### Note:

The criteria for determination above is intended merely to determine if satisfactory or not, and does not serve as the specified value for adjustments. When performing adjustments, use the specified values for adjustments.

## Forced Reset

The system microprocessor can be reset in the following procedure.

Use these procedure when the unit cannot be operated normally due to the overrunning of the microprocessor, etc.

### Procedure :

Disconnect the power plug, short-circuit jumper wire of JW705 and JW706 (RESET).

## Retry Cause Display Mode

- In this test mode, the causes for retry of the unit during recording can be displayed on the fluorescent indicator tube. During playback, the “track mode” for obtaining track information will be set. This is useful for locating the faulty part of the unit.
- The following will be displayed :
  - During recording and stop: Retry cause, number of retries, and number of retry errors.
  - During playback : Information such as type of disc played, part played, copyright.
 These are displayed in hexadecimal.

### Precedure:

- Load a recordable disc whose contents can be erased into the unit.
- Press the **MENU/NO** button. When “Edit/Menu” is displayed on the fluorescent display tube, rotate the **◀◀ AMS ▶▶** knob to display “All Erase?”.
- Press the **YES** button. (Or press the **◀◀ AMS ▶▶** knob)
- When “All Erase??” is displayed on the fluorescent display tube, the music calendar number blinks.
- Press the **YES** button to display “Complete!!”, and press the **■** button immediately. Wait for about 15 seconds while pressing the button. (The **◀◀ AMS ▶▶** knob can be pressed instead of the **YES** button for the same results.)
- When the “TOC” displayed on the fluorescent display tube goes off, release the **■** button.
- Press the **● REC** button to start recording. Then press the **||** button and start recording.
- To check the “track mode”, press the **▷** button to start play.
- To exit the test mode, press the **I/O** button, and turn OFF the power. When “TOC” disappears, disconnect the power plug from the outlet. If the test mode cannot be exited, refer to “Forced Reset” on page 8.

### Reading the Retry Cause Display

Hexadecimal	Higher Bits				Lower Bits				Hexa-decimal	Cause of Retry	Occurring conditions
	8	4	2	1	8	4	2	1			
Bit	b7	b6	b5	b4	b3	b2	b1	b0			
Binary	0	0	0	0	0	0	0	1	01	shock	When track jump (shock) is detected
	0	0	0	0	0	0	1	0	02	ader5	When ADER was counted more than five times continuously
	0	0	0	0	0	1	0	0	04	Discontinuous address	When ADIP address is not continuous
	0	0	0	0	1	0	0	0	08	DIN unlock	When DIN unlock is detected
	0	0	0	1	0	0	0	0	10	FCS incorrect	When not in focus
	0	0	1	0	0	0	0	0	20	IVR rec error	When ABCD signal level exceeds the specified range
	0	1	0	0	0	0	0	0	40	CLV unlock	When CLV is unlocked
	1	0	0	0	0	0	0	0	80	Access fault	When access operation is not performed normally

### Reading the Display:

Convert the hexadecimal display into binary display. If more than two causes, they will be added.

### Example

When 42 is displayed:  
 Higher bit: 4 = 0100 → b6  
 Lower bit : 2 = 0010 → b1  
 In this case, the retry cause is combined of “CLV unlock” and “ader5”.

When A2 is displayed:  
 Higher bit: A = 1010 → b7+b5  
 Lower bit : 2 = 0010 → b2  
 The retry cause in this case is combined of “access fault”, “IVR rec error”, and “ader5”.

### Reading the Retry Cause Display

Hexadecimal	Higher Bits				Lower Bits				Hexa- decimal	Details	
	8	4	2	1	8	4	2	1		When 0	When 1
Bit	b7	b6	b5	b4	b3	b2	b1	b0			
Binary	0	0	0	0	0	0	0	1	01	Emphasis OFF	Emphasis ON
	0	0	0	0	0	0	1	0	02	Monaural	Stereo
	0	0	0	0	0	1	0	0	04	This is 2-bit display. Normally 01. 01:Normal audio. Others:Invalid	
	0	0	0	0	1	0	0	0	08		
	0	0	0	1	0	0	0	0	10	Audio (Normal)	Invalid
	0	0	1	0	0	0	0	0	20	Original	Digital copy
	0	1	0	0	0	0	0	0	40	Copyright	No copyright
	1	0	0	0	0	0	0	0	80	Write prohibited	Write allowed

#### Reading the Display:

Convert the hexadecimal display into binary display. If more than two causes, they will be added.

Example When 84 is displayed:

Higher bit : 8 = 1000 → b7

Lower bit : 4 = 0100 → b2

In this case, as b2 and b7 are 1 and others are 0, it can be determined that the retry cause is combined of “emphasis OFF”, “monaural”, “original”, “copyright exists”, and “write allowed”.

Example When 07 is displayed:

Higher bit : 0 = 1000 → All 0

Lower bit : 7 = 0111 → b0+b1+b2

In this case, as b0, b1, and b2 are 1 and others are 0, it can be determined that the retry cause is combined of “emphasis ON”, “stereo”, “original”, “copyright exists”, and “write prohibited”.

#### Hexadecimal → Binary Conversion Table

Hexadecimal	Binary	Hexadecimal	Binary
0	0000	8	1000
1	0001	9	1001
2	0010	A	1010
3	0011	B	1011
4	0100	C	1100

This section describes how to hook up the MD deck to an amplifier or other components such as a CD player or DAT deck. Be sure to turn off the power of each component before connection.

→: Signal flow

### What cords will I need?

- Audio connecting cords (supplied) (2)
  - White (L)
  - Red (R)
- Optical cables (only one supplied) (3)
- Coaxial digital connecting cables (not supplied) (2)

### Hookups

**Connecting the deck to an amplifier**  
Connect the amplifier to the LINE (ANALOG) IN/OUT jacks using the audio connecting cords (supplied), making sure to match the color-coded cords to the appropriate jacks on the components: red (right) to red and white (left) to white. Be sure to make connections firmly to prevent hum and noise.

→: Signal flow

**Connecting the deck to a digital component such as a CD player, DAT deck, digital amplifier, or another MD deck**

Connect the component through the DIGITAL OPTICAL IN/OUT or DIGITAL COAXIAL IN/OUT connectors with two (or three) optical cables (only one supplied) and/or two coaxial digital connecting cables (not supplied).

### When using the optical cables

Take the caps off the connectors and then insert the plugs parallelly until they click into place. Be sure not to bend or tie together the optical cables.

You can connect the optical cable to either OPTICAL IN1 or IN2

→: Signal flow

When using the coaxial digital connecting cable

→: Signal flow

⚠ If "Din Unlock" and "C71" appear in the display Make sure the optical cable or the coaxial digital connecting cable is connected properly.

⚠ Automatic conversion of digital sampling rates during recording

A built-in sampling rate converter automatically converts the sampling frequency of various digital sources to the 44.1 kHz sampling rate of your MD deck. This allows you to record sources such as 32- and 48-kHz DAT or satellite broadcasts, as well as compact discs and other MDs.

### Note

If "Din Unlock" alternates with "C71", or "Cannot Copy" appears in the display, recording through the digital connector is not possible. In this case, record the program source through the LINE (ANALOG) IN jacks with the INPUT switch set at ANALOG.

### Connecting the AC power cord

Connect the AC power cord to a wall outlet or to the outlet of a timer.

## About the CONTROL A1 Control System

This MD deck is compatible with the CONTROL A1 Control System.

The CONTROL A1 Control System was designed to simplify the operation of audio systems composed of separate Sony components. CONTROL A1 connections provide a path for the transmission of control signals which enable automatic operation and control features usually associated with integrated systems.

Currently, CONTROL A1 connections between a Sony MD deck, CD player, amplifier (receiver), and cassette deck provide automatic function selection and synchronized recording.

In the future the CONTROL A1 connection will work as a multifunction bus allowing you to control various functions for each component.

### Note

The CONTROL A1 Control System is designed to maintain upward compatibility as the Control System is upgraded to handle new functions. In this case, however, older components will not be compatible with the new functions.

### Compatibility with the former CONTROL A System

Although the CDP-CX153 is equipped with a CONTROL A terminal, it can be connected to CONTROL A1 components using a special connecting cable\*.

The CDP-CX151 however, cannot be connected to CONTROL A1.

\* Use the Sony RK-G139HG (1 meter [39 3/4 in]) monaural mini-plug ↔ stereo mini-plug connecting cable or a similar cable (less than 2 meters [78 3/4 in] long with no resistance).

Be sure to connect the STEREO mini-plug to the CONTROL A component and the MONO mini-plug to the CONTROL A1 component.

## Connecting the CONTROL A1 Control System

- Connect the CONTROL A1 cables in series to the CONTROL A1 jacks on the back of each component. Be sure to connect a CONTROL A1 compatible amplifier (receiver) to take advantage of the automatic function selection feature.

- The components can be connected in any order.
- You can connect up to ten CONTROL A1 compatible components.
- The CONTROL A1 functions will work when the component you want to operate is turned on, even if all of the connected components are not turned on.
- As a rule, the CONTROL A1 remote control system should not incorporate more than one of each type of component (i.e., 1 MD deck, 1 CD player, 1 tape deck and 1 receiver). You may, however, be able to connect more than one of certain CD players. Refer to the operating instructions supplied with the respective component for details.

### About the CONTROL A1 cable

- Use a commercially available 2P (mono) mini-plug cable less than 2 meters (78 3/4 in.) long, with a maximum outer diameter no greater than 11 mm (7/16 in.), and no resistance. Some CONTROL A1 compatible components are supplied with a CONTROL A1 cable as an accessory.
- If a component has more than one CONTROL A1 jack, you can use either one, or connect a different component to each jack.

"S-LINK" is a general name for Sony's Bus System, and includes the CONTROL A1 Control System.

## Setting the Clock

Once you set the MD deck's internal clock, the MD deck will automatically record the date and time of all recordings. When playing a track, you can display the date and time the track was recorded (see page 24). Time on this deck is displayed on a 12-hour clock (USA and Canadian models only) or a 24-hour clock (European model only).

- With the deck in standby status (the STANDBY indicator lights red), press SCROLL/CLOCK SET down for about 2 seconds until the month (or day) indication in the display starts flashing.

USA and Canadian models

European model

- Turn AMS to enter the current month (or day), then press AMS. The month (or day) indication stops flashing, and the day (or month) indication starts flashing.

USA and Canadian models

European model

(Continued)

- Repeat Step 2 to enter the month, day, year, hour, and minute.

USA and Canadian models

European model

- For precise time and date stamping of recordings. Reset the time at least once a week.

### Note

If the AC power cord is disconnected for a long time, the memorized clock settings will disappear and "STANDBY" will flash in the display the next time you plug in and turn on the deck. If this happens, reset the clock.

## Displaying the current date and time

You can display the current date and time any time even when the deck is in standby status.

Press DATE PRESENT.

Each press of the button changes the display as follows:

- You can display the current date and time with an on-deck button.

Press the SCROLL/CLOCK SET button. Each press of the button changes the display in the same order as the DATE PRESENT button on the remote does.

## Changing the date and/or time

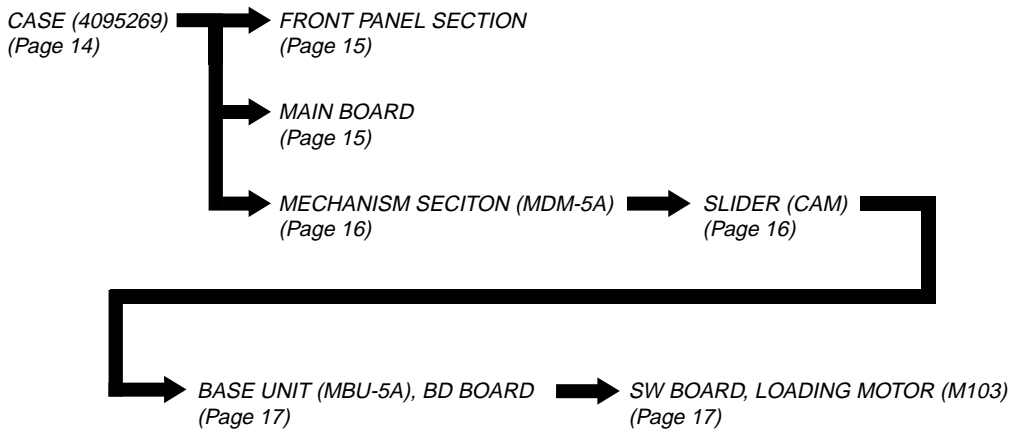

- With the deck in standby status (the STANDBY indicator lights red), press SCROLL/CLOCK SET down for about 2 seconds until the month (or day) indication in the display starts flashing.
- Press SCROLL/CLOCK SET or AMS repeatedly until the item you want to change flashes.
- Turn AMS to change the contents of the selected item.
- To complete the setting, press AMS repeatedly until all items stop flashing.

## Deactivating the demonstration mode

If the MD deck does not contain a disc, demonstration mode is activated automatically after about ten minutes. To deactivate the demonstration mode, press any button on the MD deck or the remote.

- Check and adjust the MDM and MBU as follows.  
The procedure changes according to the part replaced

- Abbreviation  
OP : Optical pick-up  
OWH : Overwrite head

## 2. PRECAUTIONS FOR CHECKING LASER DIODE EMISSION

To check the emission of the laser diode during adjustments, never view directly from the top as this may lose your eye-sight.

## 3. PRECAUTIONS FOR USE OF OPTICAL PICK-UP (KMS-260A)

As the laser diode in the optical pick-up is easily damaged by static electricity, solder the laser tap of the flexible board when using it. Before disconnecting the connector, desolder first. Before connecting the connector, be careful not to remove the solder. Also take adequate measures to prevent damage by static electricity. Handle the flexible board with care as it breaks easily.

**Optical pick-up flexible board**

## 4. PRECAUTIONS FOR ADJUSTMENTS

1. When replacing the following parts, perform the adjustments and checks with ○ in the order shown in the following table.

	Optical Pick-up	BD Board			
		IC171	D101	IC101, IC121	IC192
1. Initial setting of adjustment value	○	○	×	○	×
2. Recording of IOP information (Value written in the pick-up)	○	○	×	×	×
3. Temperature compensation offset adjustment	×	○	○	×	×
4. Laser power adjustment	○	○	×	○	○
5. Traverse adjustment	○	○	×	○	×
6. Focus bias adjustment	○	○	×	○	×
7. Error rate check	○	○	×	○	×
8. Auto gain output level adjustment	○	○	×	○	×

- Set the test mode when performing adjustments. After completing the adjustments, exit the test mode. Perform the adjustments and checks in “group S” of the test mode.
- Perform the adjustments to be needed in the order shown.

- Use the following tools and measuring devices.
  - Check Disc (MD) TDYS-1 (Parts No. 4-963-646-01)
  - TEST DISK (MDW-74/AU-1) (Parts No. 8-892-341-41)
  - Laser power meter LPM-8001 (Parts No. J-2501-046-A) or MD Laser power meter 8010S (Parts No. J-2501-145-A)
  - Oscilloscope (Measure after performing CAL of prove.)
  - Digital voltmeter
  - Thermometer
  - Jig for checking BD board waveform (Parts No. : J-2501-149-A)
- When observing several signals on the oscilloscope, etc., make sure that VC and ground do not connect inside the oscilloscope. (VC and ground will become short-circuited.)
- Using the above jig enables the waveform to be checked without the need to solder. (Refer to Servicing Notes on page 6.)
- As the disc used will affect the adjustment results, make sure that no dusts nor fingerprints are attached to it.

## Laser power meter

When performing laser power checks and adjustment (electrical adjustment), use of the new MD laser power meter 8010S (J-2501-145-A) instead of the conventional laser power meter is convenient.

It sharply reduces the time and trouble to set the laser power meter sensor onto the objective lens of the pick-up.

## 5. CREATING CONTINUOUSLY RECORDED DISC

\* This disc is used in focus bias adjustment and error rate check. The following describes how to create a continuous recording disc.

- Insert a disc (blank disc) commercially available.

- Press the [YES] button again to display “CREC MID”. Display “CREC (0300)” and start to recording.
- Complete recording within 5 minutes.
- Press the [MENU/NO] button and stop recording .
- Press the [EJECT] button and remove the disc.

The above has been how to create a continuous recorded data for the focus bias adjustment and error rate check.

### Note :

- Be careful not to apply vibration during continuous recording.

BD

**NOTE:**

- Due to standardization, replacements in the parts list may be different from the parts specified in the diagrams or the components used on the set.
- -XX and -X mean standardized parts, so they may have some difference from the original one.
- **RESISTORS**  
All resistors are in ohms.  
METAL: Metal-film resistor.  
METAL OXIDE: Metal oxide-film resistor.  
F: nonflammable

- Items marked “\*” are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
- **SEMICONDUCTORS**  
In each case, u:  $\mu$ , for example:  
uA. . :  $\mu$ A. .      uPA. . :  $\mu$ PA. .  
uPB. . :  $\mu$ PB. .    uPC. . :  $\mu$ PC. .  
uPD. . :  $\mu$ PD. .
- **CAPACITORS**  
uF:  $\mu$ F
- **COILS**  
uH:  $\mu$ H

The components identified by mark  $\Delta$  or dotted line with mark  $\Delta$  are critical for safety. Replace only with part number specified.

Les composants identifiés par une marque  $\Delta$  sont critiques pour la sécurité. Ne les remplacer que par une pièce portant le numéro spécifié.

When indicating parts by reference number, please include the board.
